Introduction

A QR code often carries data that should not leave the company: an internal link, a phone number, the password of a guest network. Before a tool for such codes is allowed on the intranet, an administrator wants to know where this data goes. This article answers the question for QR Code Generator: where the code is built, what the solution is permitted to do, where the entered data is stored and which requests the web part sends outside the tenant.

Summary for administrators

Question	Answer
Where is the QR code generated?	In the browser of the user
Is the encoded data sent to Vitextra or to a third party?	No
Which API permissions does the package request?	None
Does the web part read SharePoint lists, files or user profiles?	No
Where is a saved configuration stored?	In the properties of the web part, inside the SharePoint page
Who can read a saved configuration?	Everyone who can open the page
What is sent to Vitextra services?	Technical identifiers for the license check and usage telemetry; no content of the codes

The code is generated in the browser

The web part turns the entered data into a QR code with a script that runs in the browser. The data from the fields is not sent to a server to be encoded, and the image is drawn on the device of the user. **Download** and **Copy** work in the browser as well: the file is created locally and goes to the downloads folder or to the clipboard.

Permissions of the solution

QR Code Generator is a **SharePoint Framework** web part that is deployed from the **app**

catalog.

- The package requests **no API permissions**. Nothing appears for approval on the **API access** page of the SharePoint admin center, and the web part does not call Microsoft Graph.
- The web part does not read or change lists, libraries, files or user profiles. From the page it takes only the address of the current site, to pre-fill the **URL** field.
- The uploaded logo is not saved to a library: it is kept inside the configuration of the web part.

What users need

Task	Required permission
Upload the package to the app catalog	SharePoint administrator, or owner of the app catalog
Add the web part to a page, save a prepared code	Edit permission on the page
See the prepared code, make, copy and download codes	Read permission on the page

Where a saved configuration is stored

When a page with the web part is edited and saved, the whole configuration of the generator is saved with it: the values of the fields on all data tabs, the design, the logo and the size. Technically it is one of the properties of the web part, stored inside the page in the **Site Pages** library of the site.

Three consequences follow.

The data is stored as plain text. The configuration is not encrypted. The fields, including **Password** on the **Wi-Fi** tab, are shown as ordinary text next to the code.

The permissions of the page are the permissions of the data. Everyone who can open the page can read everything that is saved in the web part. The web part has no settings that hide the fields from readers.

Previous versions are kept. SharePoint keeps the version history of a page. A password that was saved in the web part and later replaced remains in the earlier versions of the page, available to those who can view the version history.

Warning

Do not save the passwords of corporate networks or other secrets in the web part. Use it for data that the whole audience of the page is allowed to know, such as the password of a guest network on a page for employees.

Data that a visitor enters on a published page without editing it is not stored anywhere. It exists in the browser until the page is closed or reloaded.

Requests to Vitextra services

The web part contacts services outside the tenant for three purposes. None of the requests contains the data entered into the generator or the generated code.

Purpose	What is sent	Where
License check	The tenant ID, the ID of the user account in Microsoft Entra ID, the address of the site, the identifier, name and version of the product	`vitextra.com`
Usage telemetry	An event when the web part is loaded: the product name and version, the ID and address of the site, the ID of the user account, the language of the interface and whether the web part runs in Teams	Azure Application Insights
Loading the product files	Nothing but an ordinary request for a file: the scripts of the web part and its icons are downloaded from the Vitextra content delivery network	`static.vitextra.com`, `vitextra-storage.azureedge.net`

The user is identified in these requests by the ID of the account — a GUID — and not

by name or email address.

Note

If your organization restricts outbound connections, allow the hosts listed above. Without access to the content delivery network the web part cannot load. The processing of data by Vitextra is described in the Privacy Policy.

What is inside a QR code

A QR code is not protected in any way. It contains the data itself, and any scanner shows it. Three things are worth remembering:

- a code with a password is as confidential as the password — whoever has a photo of the code has the password;
- a code does not expire and cannot be revoked. To make a printed code useless, change what it points to: the password of the network, the address of the page;
- a code with an internal link opens only for people who have access to the linked page; the code itself reveals only the address.

Recommendations

1 Publish codes with sensitive data on pages whose audience matches the audience of the code, and check the permissions of the page before publishing.
2 Use the **Wi-Fi** tab for guest networks only, and renew the code when the password is changed.
3 Before publishing, clear the fields of the tabs that are not used — their values are saved too.
4 Where a link is enough, prefer the **URL** tab with a link to a protected page over a code that carries the data itself.

Summary

QR Code Generator builds the code in the browser, needs no API permissions and reads nothing from SharePoint. The only place where the entered data is kept is the page on which an editor saves it, and there the data is as open as the page is.

Tip

How a prepared code is saved and what the visitors of the page see is described in KB10269. Publishing a Preconfigured QR Code on a SharePoint Page.

Terms

App Catalog
The App Catalog is a special SharePoint site that stores apps for SharePoint, Teams, and other Microsoft 365 services. Global or SharePoint administrators can upload and manage applications from the AppSource marketplace, custom-developed apps, or third-party apps for the organization's internal use. There can be only one tenant-level App Catalog in a tenant; site collection app catalogs can be added for individual site collections.

SharePoint Framework (SPFx)
SharePoint Framework (SPFx) is a model for building client-side web parts, components, and extensions for SharePoint Online, SharePoint Server (on-premises), and Microsoft Teams. SPFx customizations are based on JavaScript and support the modern user interface natively.
